FICTITIOUS EXAMPLE

Molecular Pathology Report - RNA Fusion Analysis

Patient	Tommen BIRMINGHAM
Date of birth	07-Sep-1999
Report number	MP-2025-004711
Report date	12-Mar-2025
Specimen	FFPE lung biopsy, collected 04-Mar-2025
Tumour content	60%

Clinical question

Lung adenocarcinoma. Testing for gene fusions to guide first-line treatment.

Results

EML4-ALK fusion detected: EML4 exon 13 :: ALK exon 20 (variant 1). No ROS1, RET, NTRK1, NTRK2 or NTRK3 fusion and no MET exon 14 skipping detected.

Interpretation

This ALK rearrangement is predictive of response to ALK tyrosine kinase inhibitors.

Method and limitations

Targeted RNA-based next generation sequencing fusion panel (ALK, ROS1, RET, NTRK1-3, MET exon 14 skipping). Fusions with partners or breakpoints not covered by the panel may not be detected.

Authorised by

Dr. med. Erika Mustermann, Consultant Pathologist (Fachärztin für Pathologie)
